S^X Quick Start Guide

1

INTRODUCTION

Welcome to Skylable S$^{\text{X}}$, a complete private cloud framework. This Quick Start Guide gives you the basics to install, configure and start using our software.

USEFUL LINKS

- `http://cdn.skylable.com/packages/`

- `http://lists.skylable.com`

- `https://bugzilla.skylable.com`

- `http://wiki.skylable.com`

INSTALLATION

REQUIREMENTS

Skylable S^X is tested on all popular UNIX platforms, including Linux, FreeBSD, and Mac OS X. We try to support as many platforms as possible, if you have troubles installing, compiling or running our software on your platform please open a bug report.

The latest binary packages are available at
`http://cdn.skylable.com/packages/`

In order to compile S^X from source, you will need the following packages to be installed together with their development versions:

- OpenSSL/NSS

- libcurl >= 7.34.0 (otherwise the embedded one will be used)

- zlib

For example, on Debian run:

```
# apt-get install libssl-dev libcurl4-openssl-dev libz-dev
```

COMPILATION

The software is based on autoconf, so just follow the standard installation procedure. In this guide we will install S^X into `/opt/sx`.

```
$ ./configure --prefix=/opt/sx && make
# make install
```

3

CONFIGURATION

REQUIREMENTS

S^X by default operates on the port 443 or 80, which needs to be available on a given IP address[1]. You can build just a single-node S^X cluster, however for data safety reasons it is recommended to create at least two nodes and use replica higher than 1. You can add more nodes to the cluster at any time.

THE FIRST NODE

Setting up the first node initializes the cluster and makes S^X ready to use. The sxsetup tool presented below performs an automated configuration of the S^X server, which includes creating a local data storage, SSL certificate, and default admin account. You will only need to answer a few basic questions!

In the example we assume the IP address of the first node is **192.168.1.101**, the name of the cluster is **mycluster**, and S^X was installed into /opt/sx. Also in some cases (eg. the path to S^X storage) we assume default values, how-

---

[1] You can choose a custom port when running sxsetup with in advanced mode

ever your mileage may vary.

```
# /opt/sx/sbin/sxsetup
--- SKYLABLE SX CONFIGURATION SCRIPT ---

The script will help you to create or extend a Skylable SX data
cluster.

--- CLUSTER NAME ---

Clients will access your cluster using a sx://clustername/volume/path
URI. It is recommended to use a FQDN for clustername, but not
required. Refer to the documentation for more info.
Enter the cluster name (use the same across all nodes) []: mycluster

--- DATA STORAGE ---

Please provide the location where all incoming data will be stored.
Path to SX storage [default=/opt/sx/var/lib/sxserver]: <confirm default>

Please specify the maximum size of the storage for this node. You can
use M, G and T suffixes, eg. 100T for 100 terabytes.
Maximum size [default=1T]: 500G

--- NETWORKING ---

Enable SSL? (use the same setting for all nodes in the cluster) (Y/n)
<confirm default>
Enter the IP address of this node [default=192.168.1.101]: <confirm default>
Checking port 443 on 192.168.1.101 ... OK

--- CLUSTER CONFIGURATION ---

Is this (192.168.1.101) the first node of a new cluster? (Y/n)
<confirm default>

--- SSL CONFIGURATION ---

Generating default SSL certificate and keys in
/opt/sx/etc/ssl/private/sxkey.pem /opt/sx/etc/ssl/certs/sxcert.pem
Generating a 2048 bit RSA private key
................................+++
.......................................+++
writing new private key to '/opt/sx/etc/ssl/private/sxkey.pem'

--- YOUR CHOICES ---

Cluster: sx://mycluster
Node: 192.168.1.101
Use SSL: yes
Storage: /opt/sx/var/lib/sxserver
Run as user: nobody

Is this correct? (Y/n) <confirm default>

--- CLUSTER INITIALIZATION ---

Internal cluster protocol: SECURE
Used disk space: 17568768
Actual data size: 463872
List of nodes:
        * ec4d9d63-9fa3-4d45-838d-3e521f124ed3 192.168.1.101
            (192.168.1.101) 536870912000
Storage location: /opt/sx/var/lib/sxserver
Run as user: nobody
Sockets and pidfiles in: /opt/sx/var/run/sxserver
Logs in: /opt/sx/var/log/sxserver/sxfcgi.log

--- END OF SUMMARY ---

Congratulations, the new node is up and running!
You can control it with '/opt/sx/sbin/sxserver'

You can add a new node to the cluster by running 'sxsetup' on another
server. When prompted, enter the 'admin key', 'SSL private key' and
'SSL certificate' printed above.

You can run 'sxacl useradd joe sx://admin@mycluster' to add a new user.
To create a new volume owned by user 'joe' run:
'sxvol create --owner joe --replica N --size SIZE sx://admin@mycluster/
    VOLNAME'
```

When the script finishes successfully, the node is already functional. Please notice the admin key listed at the end of the summary: it will be needed for both adding more nodes and accessing the cluster. You can always retrieve the admin key with the following command:

```
# /opt/sx/sbin/sxserver status
--- SX STATUS ---
sx.fcgi is running (PID 14394)
sxhttpd is running (PID 14407)

--- SX INFO ---
Cluster name: mycluster
Cluster port: 443
HashFS Version: SX-Storage 1.5
Cluster UUID: 01dca714-8cc9-4e26-960e-daf04892b1e2

SSL private key: /opt/sx/etc/ssl/private/sxkey.pem
SX Logfile: /opt/sx/var/log/sxserver/sxfcgi.log
```

That's it - your SX storage is already up and running! You can now go to the next step and add more nodes or go

to the next chapter and learn how to perform basic client operations.

ADDING MORE NODES

Follow these steps to add a new node to the cluster:

- Run 'sxserver status' on one of the nodes of the cluster
- Collect the following information:
    - Cluster name
    - Admin key
    - One of the IP addresses from the list of nodes
    - The content of the SSL private key file (not the path itself!)
- Compile and install S^X with `./configure --prefix= /opt/sx && make install`
- Run `/opt/sx/sbin/sxsetup` and provide the collected information. Below we assume the new node is 192.168.1.102 and it's size is 250 GBs.

```
# /opt/sx/sbin/sxsetup
--- SKYLABLE SX CONFIGURATION SCRIPT ---

The script will help you to create or extend a Skylable SX data
cluster.

--- CLUSTER NAME ---

Clients will access your cluster using a sx://clustername/volume/path
URI. It is recommended to use a FQDN for clustername, but not
required. Refer to the documentation for more info.
Enter the cluster name (use the same across all nodes) []: mycluster

--- DATA STORAGE ---

Please provide the location where all incoming data will be stored.
Path to SX storage [default=/opt/sx/var/lib/sxserver]: <confirm default>

Please specify the maximum size of the storage for this node. You can
use M, G and T suffixes, eg. 100T for 100 terabytes.
Maximum size [default=1T]: 250G

--- NETWORKING ---

Enable SSL? (use the same setting for all nodes in the cluster) (Y/n)
<confirm default>
```

```
Enter the IP address of this node [default=192.168.1.102]: <confirm default>
Checking port 443 on 192.168.1.102 ... OK

--- CLUSTER CONFIGURATION ---

Is this (192.168.1.102) the first node of a new cluster? (Y/n) n
Please provide the IP address of a working node in 'mycluster'.
IP address: 192.168.1.101

The admin key is required to join the existing cluster.
If you don't have it, run 'sxserver status' on 192.168.1.101.
Below you can provide the key itself or path to the file
containing the key.
Admin key or path to key-file:
ODPiKuNIrrVmD8IUCuw1hQxNqZfIkCY+oKwxi5zHSPn5yOSOi3IMawAA

--- SSL CONFIGURATION ---

Please paste the SSL private key below (and press CTRL+D when
done) or provide a path to it.

Logs in: /opt/sx/var/log/sxserver/sxfcgi.log

--- END OF SUMMARY ---

Congratulations, the new node is up and running!
You can control it with '/opt/sx/sbin/sxserver'

You can add a new node to the cluster by running 'sxsetup' on another
server. When prompted, enter the 'admin key', 'SSL private key' and
'SSL certificate' printed above.

You can run 'sxacl useradd joe sx://admin@mycluster' to add a new user.
To create a new volume owned by user 'joe' run:
'sxvol create --owner joe --replica N --size SIZE sx://admin@mycluster/
    VOLNAME'
```

The node successfully joined the cluster - at the end of the summary you can see the current list of nodes in the cluster. Repeat the same steps to add more nodes to the cluster.

CLIENT OPERATIONS

ACCESSING THE CLUSTER

To access the cluster you need to have credentials for an existing account. In this example we will use the default admin account created during cluster setup.The following command sets up the admin access to the S^X cluster "mycluster" for the client tools. Because "mycluster" is not a DNS name, we need to point sxinit to one of the nodes of the cluster. It will automatically discover the IP addresses of the other nodes. Additionally, we create an alias **@cluster**, which later can be used instead of **sx://admin@mycluster**.

```
$ sxinit -l 192.168.1.101 -A @cluster sx://admin@mycluster
Warning: self-signed certificate:

        Subject: C=GB, ST=UK, O=SX, CN=mycluster
        Issuer: C=GB, ST=UK, O=SX, CN=mycluster
        SHA1 Fingerprint: 84:EF:39:80:1E:28:9C:4A:C8:80:E6:56:57:A4:CD:64:2E
           :23:99:7A

Do you trust this SSL certificate? [y/N] y
Trusting self-signed certificate
Please enter the user key:
ODPiKuNIrrVmD8IUCuw1hQxNqZfIkCY+oKwxi5zHSPn5yOSOi3IMawAA
```

S^X allows creating additional users of your choice and assigning them appropriate privileges. In this Quick Start Guide we will only use the default admin account, though. Please refer to `sxacl useradd --help` on how to add new users to the cluster.

CREATING NEW VOLUMES

Volumes are logical partitions of the S^X storage assigned to particular groups of users and managed with the `sxvol` tool. Below we create a basic volume of size 50G owned by admin and fully replicated on two nodes. We're also making use of the @cluster alias, which stands for sx://admin@mycluster.

```
$ /opt/sx/bin/sxvol create --owner=admin --replica=2 --size=50G
  @cluster/mydata
Volume 'mydata' (replica: 2, size: 50G, max-revisions: 1) created.
```

WORKING WITH FILES

S^X provides easy to use file tools, which resemble typical UNIX commands. Below we show how to upload a file to the 'mydata' volume, display it, and list files in the volume.

```
$ echo Hello World! > /tmp/hello.txt
$ sxcp /tmp/hello.txt @cluster/mydata/
$ sxcat @cluster/mydata/hello.txt
Hello World!
$ sxls @cluster/mydata/
sx://admin@mycluster/mydata/hello.txt
$ sxrm @cluster/mydata/hello.txt
Deleted 1 file(s)
```

Use `sxcp -r` to recursively upload directories to S^X. See the man pages (eg. `man sxcp`) for examples and usage details.
